Colour frequency and phototherapy

With silver people speak of “moonlight” and a “pure frequency”. It sounds as if it had its own number that can be read. A silver surface **reflects** light, a silver lamp **emits** light. Let us say which of that is **atmosphere** and which is already **treatment**.

And this is exactly where it is good to put **miraculous promises** aside. A silver wall or a silver filter is not in itself a therapeutic light method.

Silver is not light with a frequency of its own

Silver reflects visible light very well and, according to one review, better than aluminium at longer wavelengths. That is why it is used in mirrors. The silver impression arises from a combination of light grey and shine. The colour of an object, the intensity of the light and the feeling of the surroundings are connected, but they are not interchangeable.

Bacteria and silver

Silver ions disrupt the metabolism of bacteria and silver is used in wound dressings, in some catheters and breathing tubes, and in some textiles and water treatment. That is technology, though, not a colour. **A silver spoon or a silver fabric does not heal.**

Silver and light

Silver halides are sensitive to light and for a long time stood behind film photography. Demand fell with the arrival of digital capture. Silver thus carries light and memory, but not a healing effect.

Moonlight and sleep

Moonlight is soft and faint. If you sleep badly, deal with it with a doctor. Bright-light therapy for seasonal depression uses designated devices and a specific procedure, not the colour silver.

When it is pleasant to switch off the shine

Too many glossy surfaces can dazzle. Some people enjoy shine, others need calm. You do not have to learn to love glitter for your work with colours to be right.
